This project demonstrates my ability to:

- Design exceptional products from start to finish, participating in all phases of design, from definition to development and optimization.
- Communicate and share often in written, verbal, and visual forms to create alignment and move the work towards implementation.
- Connect business strategies, available technologies, and design solutions to deliver best-in-class user experiences.

Key Responsibilities

- **Recommend research plans** which fit within the project budget, and assist project managers in defining schedule, scope, and dependencies.
- Plan, write, and conduct **stakeholder interviews** for two groups of stakeholders: business team and marketing team members.
- Gather critical business and strategy information for the implementation team and create an **easy to understand UX brief** to guide implementation, including defining strategic priorities and measures of success. (*In progress*)
- **Conduct and analyze user research** to identify opportunities for improvement in information architecture and improvement of visibility of hours, including **tree testing** and **moderated remote user interviews**. (*In progress*)
- Recommend holistic, **WordPress-based solutions** which satisfy user needs and business requirements, considering factors such as overall budget, SEO and analytics opportunities, content management requirements, existing codebase and product opportunities, vendor system requirements, and potential custom development opportunities.

Challenges & Responses

Challenges

- Showcase a **multitude of program offerings** and facilities without overwhelming users.
- **Reduce confusion and friction** in finding hours for multiple facilities, some of which are inside other facilities and close earlier than the parent facility.
- Making the best use of a **limited project budget**, and ensuring the implementation team has both the right information and sufficient resources to solve user pain points after strategy is complete.

Responses

- I leveraged **stakeholder interviews** to identify and summarize differentiating factors to guide content, functionality, and creative decisions.
- The FitRec team and I collaborated to explore how a **mega navigation** and **user-focused labeling** could surface many unique programs without confusing or overwhelming users.
- I identified key needs to prioritize, and am currently using user research to **identify requirements** for customized hours functionality.
- **Strategic use of research** allowed us to lower the overall strategy budget, allowing more time for custom implementation and quality design work.
